# Supply Chain Visibility

Gain Visibility, Control, and Agility

Supply Chain Visibility gives a clear view of inventory and supply chain activity, creating an agile global supply chain.

GT Nexus Supply Chain Visibility provides a high-resolution look at supply chain activity, from sourcing to customer delivery. Trading partners access a single source of truth on where inventory is across the globe — they use it to quickly adapt their logistics plans to current demand and combat supply chain risk due to disruptions and supply chain complexity.

GT Nexus Supply Chain Visibility Components

- **In-transit Visibility:** Reliable supply chain visibility for all in-transit inventory, from origin to final destination. Establish central event management for all product moves.

- **Production Visibility:** Real-time information about production status, whether or not manufacturing is outsourced.

- **On-hand Visibility:** A complete picture of inventory in the supply chain, created by linking in-transit and on-hand visibility. Forward project inventory positioning at destination DCs with dynamic ETAs.

- **Cost Visibility:** Visibility into landed costs of globally source goods. Determine true costs of products by the time they arrive at destination.

Key Features

- End- to-end supply chain visibility from supply to end customer delivery

- Proven, dynamic ETA modeling that enables easy comparison of actual to expected performance

- Exception dashboards that place focus on products that are not fl owing according to plan

- Ability to analyze product profitability by capturing, calculating, and reporting actual landed cost information

Benefits

- Creates a lean supply chain by managing and controlling in-transit inventory

- Increases cross-dock/flow-through by proactive allocation of in-transit inventory

- Identifies and eliminates delays before they become problems, reducing variability

- Improves product profitability by identifying and eliminating wasteful processes
